

ABSTRACT

A breakable container, commonly called a piñata, has a first half, a second half, a fastener to attach the halves together, and a decorative portion. The first half and the second half form a hollow main body when they are assembled by engaging the fastener. The decorative portion is attached to the main body, and the halves are made of fragile material. The halves includes first half projections, and second half projections that form main projections that extend from the main body. The decorative portion includes cone-shaped decoration enclosures having connecting ends that are attached to the main projections. The fastener includes fixing projections on the first half projections, and fixing recesses on the second half projections along the mating line. The fixing projections are inserted into the fixing recesses and fit tight with each other when the first half and the second half are assembled.
